Animal Intrusion Detection Model based on Temporal Convolutional Network for Smart Farming

Abstract

Human-wildlife conflicts arising from habitat encroachment and deforestation have led to an

alarming increase in crop raiding, causing substantial losses to farmers and posing risks to human

safety. Conventional methods, ranging from lethal measures to non-lethal deterrents, have proven

insufficient, often leading to environmental pollution, high costs, and limited effectiveness. In

response to these challenges, this project proposes novel Integrated Wildlife Management System

that combines Computer Vision, leveraging Temporal Convolutional Networks (TCN), for precise

animal species detection and recognition, with a targeted ultrasound emission technique for

species-specific repelling. The system, driven by edge computing, ensures real-time responsiveness

to mitigate crop raiding. The workflow commences with the activation of the camera by the edge

computing device, triggering the deployment of an advanced Animal Intrusion Detection Model. This

model accurately identifies the invading species, and upon detection, transmits a message to the

Animal Repelling Module. In response, the module emits a species-specific ultrasound, effectively

deterring the encroaching wildlife. Distinguishing itself from traditional methods, our approach

minimizes environmental pollution and addresses financial constraints associated with maintenance

costs and reliability issues. By incorporating cutting-edge technologies, the Integrated Wildlife

Management System offers a robust and adaptable solution for safeguarding crops from a variety of

wild animals, such as elephants, wild boar, and deer. By leveraging cutting-edge technology, the

proposed solution seeks to strike a balance between protecting crops and minimizing environmental

impact. This project contributes to the ongoing discourse on human-wildlife conflict resolution and

highlights the potential of technology-driven solutions in fostering coexistence between agriculture

and biodiversity.

Software specification

Server Side: Python 3.7.4(64-bit) or (32-bit)

Client Side : Bootstrap

IDE: IDLE, Flask 1.1.1

Back end : MySQL 5.

Server: Wampserver 2i

DL DLL: TensorFlow, Pandas, SiKit Learn
